1. The first step is to identify the problem or question that needs to be answered. This involves understanding the context and the specific requirements of the task.

1000

$\mathbb{R}^n$  and  $\mathbb{R}^m$  are the real coordinate spaces of dimension  $n$  and  $m$  respectively.  $\mathbb{C}^n$  is the complex coordinate space of dimension  $n$ .  $\mathbb{R}^n$  and  $\mathbb{R}^m$  are the real coordinate spaces of dimension  $n$  and  $m$  respectively.  $\mathbb{C}^n$  is the complex coordinate space of dimension  $n$ .

100

$\mathcal{H}_1 = \{ \mathbf{h}_1, \mathbf{h}_2, \dots, \mathbf{h}_M \}$  and  $\mathcal{H}_2 = \{ \mathbf{h}_{M+1}, \mathbf{h}_{M+2}, \dots, \mathbf{h}_{M+N} \}$  are the two sets of hypotheses. The test statistic is  $T(\mathbf{y}) = \sum_{i=1}^M y_i^2$ . The decision rule is  $\delta(\mathbf{y}) = 1$  if  $T(\mathbf{y}) \geq \tau$  and  $\delta(\mathbf{y}) = 0$  otherwise. The threshold  $\tau$  is chosen such that the probability of false alarm is  $\alpha$ . The probability of detection is  $\beta$ . The ROC curve is the plot of  $\beta$  versus  $\alpha$ . The AUC is the area under the ROC curve. The AUC is a measure of the performance of the detector. The AUC is 0.5 for a random detector and 1.0 for a perfect detector. The AUC is 0.75 for a detector with a ROC curve that is a straight line from (0,0) to (1,1). The AUC is 0.85 for a detector with a ROC curve that is a curve from (0,0) to (1,1). The AUC is 0.95 for a detector with a ROC curve that is a curve from (0,0) to (1,1). The AUC is 1.0 for a detector with a ROC curve that is a curve from (0,0) to (1,1).
